Profile Summary

- Full-stack engineer at an AI education startup, owning four production surfaces end to end — landing page, in-app navigation, Study Assistant, and Study Rooms — across React frontend, serverless APIs, and Postgres schema.
- Published [@burnix/cli](https://www.npmjs.com/~burnix/cli) on npm — a CLI enforcing hard spend caps on LLM API calls, including a documented concurrency fix after measuring 4.2x overshoot under parallel load.
- Strong production debugger: diagnosed and recovered a platform-wide outage from Row-Level Security misconfiguration across 21 tables, and resolved a schema/type mismatch causing silent write failures.

Technical Skills

Languages: TypeScript, JavaScript, SQL, Python

Backend: Node.js, Vercel serverless functions, Supabase, PostgreSQL, Row-Level Security, OAuth 2.0, SSE / streaming APIs, REST

Frontend: React, Vite, Tailwind CSS, streaming UI, Framer Motion

Tooling: Git, Playwright, ffmpeg, npm publishing, Claude Code

Experience

FschoolAI — Full-Stack Engineer (Intern)

AI-powered academic platform for university students

Pune, India

2025 – Present

- Own four production surfaces end to end — landing page, in-app navigation, Study Assistant, and Study Rooms — from Postgres schema and serverless endpoints through to UI.
- Diagnosed and recovered a platform-wide outage: Row-Level Security had been incorrectly re-enabled across 21 public tables, returning 401s app-wide. Traced the regression and restored access without data loss.
- Resolved a schema/type mismatch in the flashcard system where foreign-key types disagreed with the referenced tables, causing silent write failures; corrected the schema and the type definitions consuming it.
- Parallelised Canvas LMS synchronisation, cutting sync time by roughly 7x and removing the slowest step in user onboarding.
- Migrated the Study Assistant from request-response to server-sent-event streaming across the serverless API and client, so responses render token-by-token instead of after full generation.
- Built Discord OAuth 2.0 integration with automatic guild join and slash commands, plus email verification gating on signup.
- Delivered a document study feature set — upload and text extraction, AI summaries, chat-with-document, generated quizzes and flashcards, and AI-graded practice exams — within a 12-function serverless deployment limit.
- Restructured navigation from 12 destinations to a 5-tab bottom bar, prioritising highest-traffic paths to reduce decision cost on mobile.
- Built a marketing asset pipeline using Playwright for deterministic headless rendering of animated UI with ffmpeg encoding, replacing manual screen recording.

Projects

[@burnix/cli](https://www.npmjs.com/~burnix/cli) | Node.js, TypeScript, npm | [npm](https://www.npmjs.com/~burnix/cli) | [GitHub](https://github.com/pr3tik/burnix-cli)

2026

- Published CLI enforcing hard spend caps on LLM API calls. Injects a require-hook via NODE_OPTIONS, patches global fetch inside the child process, reads real token counts off each response, and refuses requests at the cap. Fully local — no proxy, keys never leave the machine.
- Found and fixed a concurrency defect: tracking cost after each response meant 20 parallel requests all passed the check before any completed — a measured 4.2x overshoot on a \$0.05 cap.
- Rebuilt as reserve-then-reconcile with a synchronous read-modify-write so in-flight requests are visible to each other and the cap holds under parallel load. Published the failure alongside the fix.
- Supports Anthropic, OpenAI, and Groq. Demo animation is generated programmatically rather than screen-recorded, so it regenerates when output changes.

Education

Nowrosjee Wadia College

B.Sc. Computer Science

2025 – 2028

Pune, Maharashtra
